

Our magic product against scratches. The scratch remover : PolyWatch.

Plastic Watch crystals, or plastic clocks crystals scratch very easily, further to shocks or diverse frictions. So they lose brightness and shine, and look unattractive. And replacement of the crystal is often impossible, especially where watches have plastic cases. (like Swatch watches)

The Solution:

We can propose to you a very simple solution. A miracle cream of polishing which can eliminate in a short time, scratches appeared on glasses in plastics..

How to use it : It's very Simple !!

We'll send you after your payment, some instructions and advices of use and preservation of the polywatch.

This PolyWatch allows you to polish plastic, synthetic watch glasses or plexi. Like Swatch, most of Rolex, Omega, Lip, Tissot, and many other ancient watches, watch with fob, alarm clocks (like UTI) clocks, pendulums etc.

You will just need a piece of cotton wool and your tube of polywatch, and in some minutes, your glass will have recovered and beautiful brightness and a new shine.

!! PolyWatch is not effective on CRACKS or BREAKS!!

Apply polyWatch to the watch crystal. Polish the scratched areas for 2-3 minutes with great pressure at a right angle to the scratches, using a piece of cotton wool. Deep scratches need to be treated more than once. Finally, remove any remaining polyWatch with a cloth. The tube contents of 5 ml is sufficient for approximately 10-12 applications.

How it works?

The plastic crystal is very slightly dissolved and ground down by tiny abrasive particles. The edges of the scratch marks are then smoothed off and the cracks filled in with some of the original plastic from the watch crystal.

Be sure, you will mean buying me again!
